

## Re-calibrating the iPigeon Timer

If your iPigeon timer screen freezes, in full or in any part, leaving you just the UP and DOWN navigation buttons at the foot of the panel to gain access the functionality of the iPigeon, then the screen needs to be **recalibrated**, as below:-

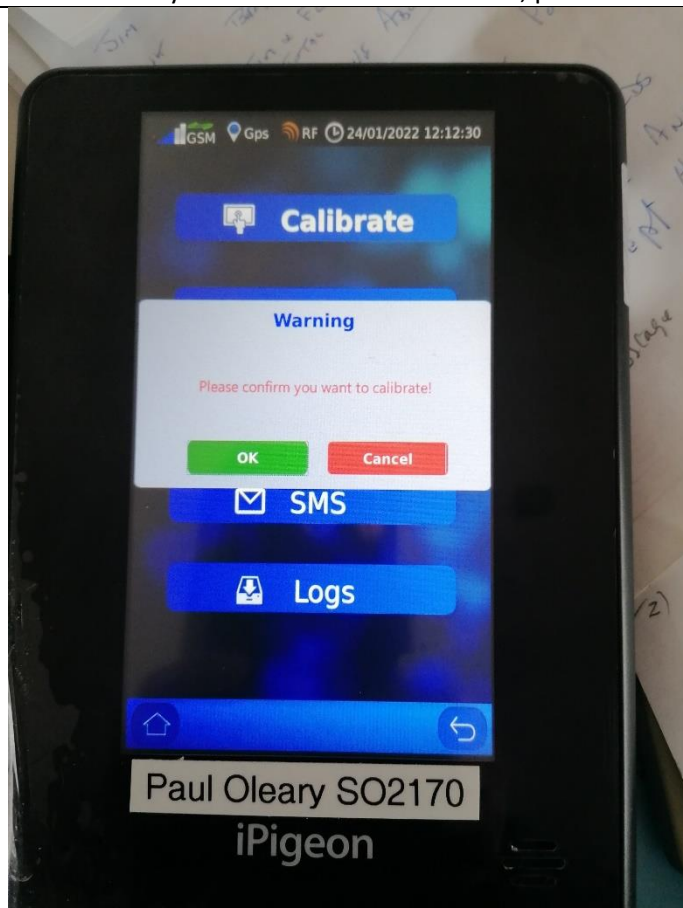

1. Navigate to and press SYSTEM TEST

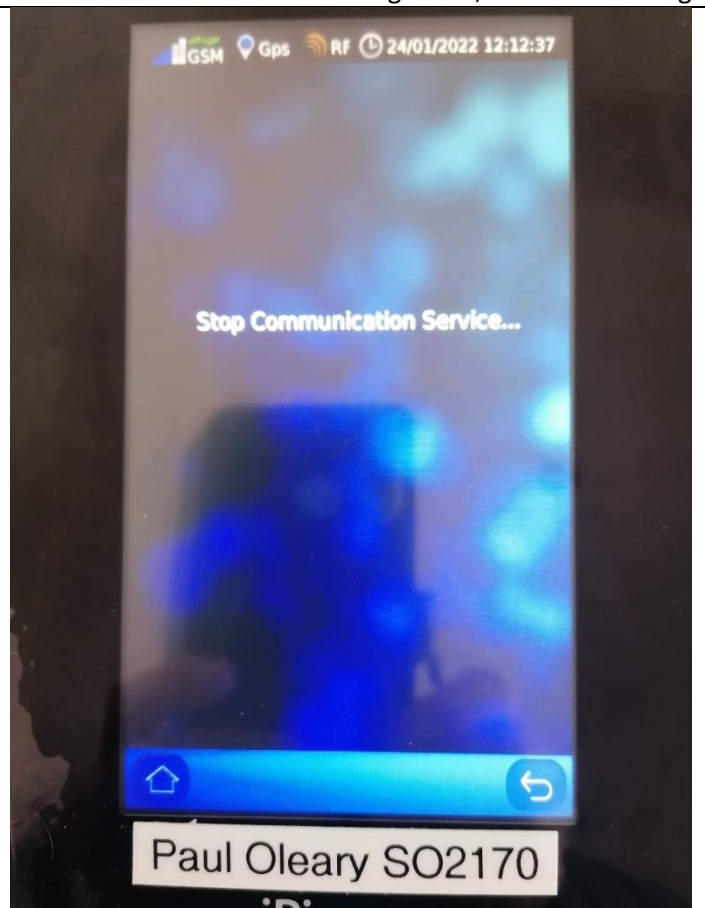

2. Navigate to and press CALIBRATE

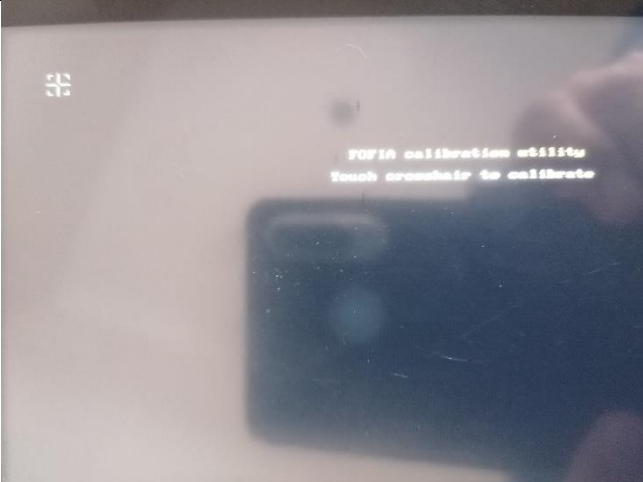

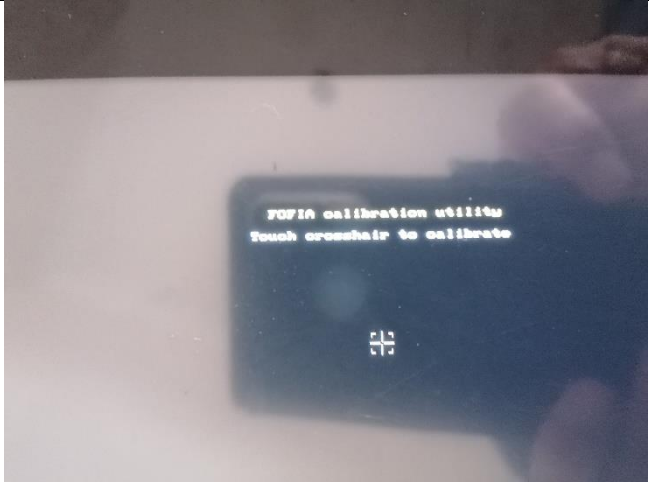

3. System will need to shut down, press OK

4. Screen will start shutting down, before restarting

<p>5. System restarts at an almost blank/black screen, you need to press the small crosshair sign in the top-left corner</p>	<p>6. Once you have click the first sign, three further corner crosshair signs need to be pressed and then a final one right in the centre of the screen</p>
	
<p>7. Once all five signs have been pressed the system will restart once more</p>	<p>8. The Menu will reappear, and all 8 tiles should be re-activated for use</p>
